ARC

Your company.
In motion.

One brief. A coordinated team.
Work you can verify.

Vultr Agent Rush 2026

The work between the tools.

A founder can describe a goal. Turning that goal into owned, checked work takes coordination.

01

Scattered context

Briefs, decisions, and files live in separate conversations.

02

Unclear ownership

Someone still has to assign the job and follow it to completion.

03

Unverified delivery

A confident reply does not show whether the work actually ran.

Designed for independent founders and small teams. Problem framing, not a measured market claim.

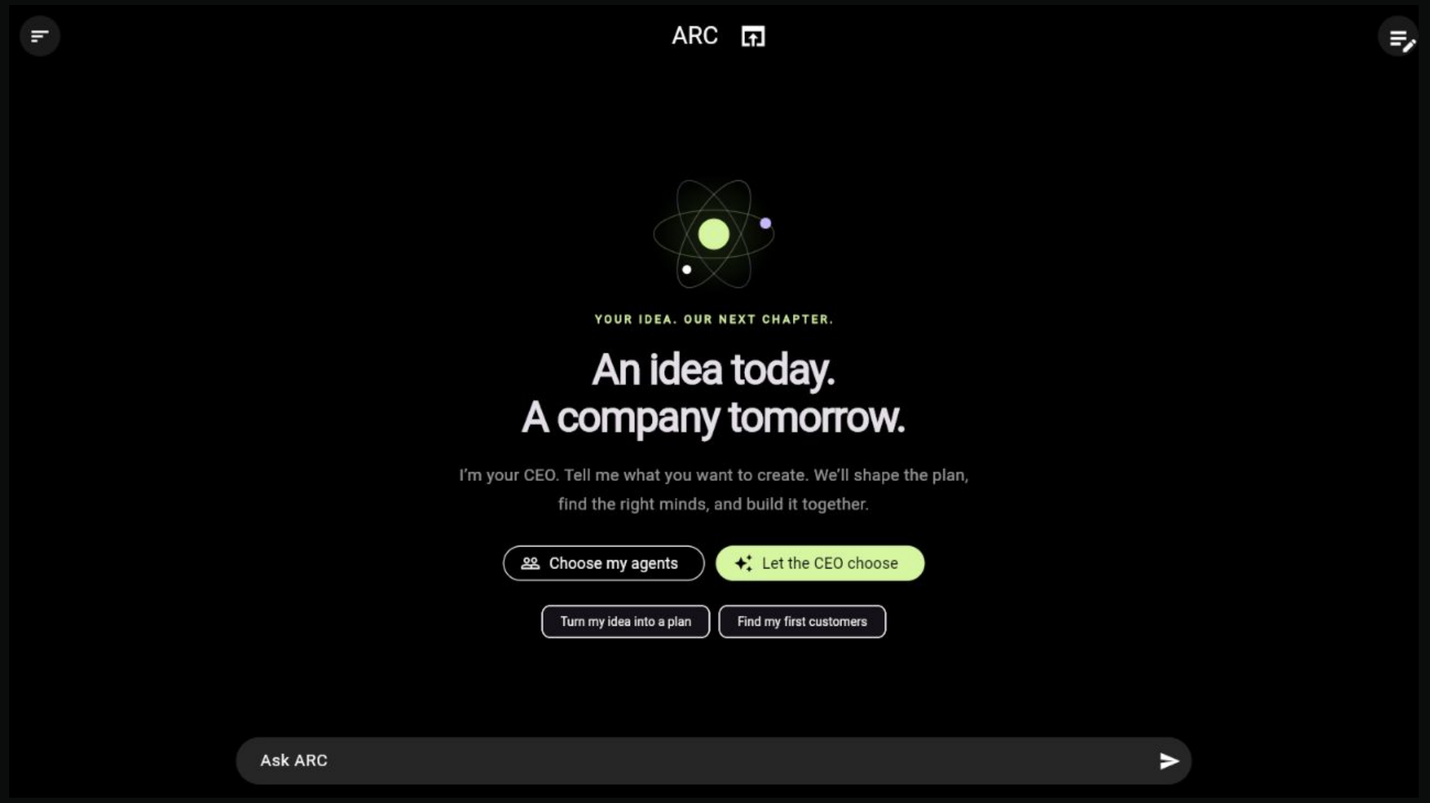

A company workspace

One CEO

A single place for the founder to set goals and make decisions.

Clear roles

Managers coordinate specialist agents and human teammates.

Actual ARC browser interface. Live application deployed on Vultr Compute in Atlanta.

A bounded job, end to end

01	**Brief**	The founder defines the outcome and constraints.
02	**Assign**	The CEO delegates through a manager to an accountable worker.
03	**Execute**	The worker inspects files, makes scoped changes, and runs checks.
04	**Verify**	A real result supports completion. Blocked work stays visible.

Example workflow: fix a shipping-discount bug and independently re-run its test.

One team. Clear ownership.

AI roles

Technology, finance, operations, marketing, and legal support.

Assigned work

Direct manager reports

Scoped tools and verification

Human teammates

Private employees and talent join through assigned jobs.

Visible job capacity

Accept, decline, and submit

Job-only access and feedback

A saved provider connection powers the CEO, specialist roles, and background reviews.

Execution, checked.

157

backend tests passed

41

app tests passed

4 + 1

Vultr containment checks

A real code change

An agent fixed a synthetic shipping bug and ran its test in the restricted terminal.

Independent verification

A separate test confirmed the fix. Four isolation checks and a timeout check passed on Vultr.

Tests and real Vultr workflow evidence verified 5-6 November 2026.

Execution has a boundary.

256 MiB

Memory limit per terminal container

1 CPU core

64-process limit

No network. No host mounts.

Non-root execution, a read-only system, and dropped capabilities.

Deadlines and cleanup

Bounded runtime and output. Disposable containers are removed after each check.

Native Linux Docker on Vultr. Execution containers have no network, credentials, or host mounts.

Vultr deployment

Live in Atlanta. Ubuntu 24.04, 2 vCPU, 4 GB RAM.

Vultr Compute

The central Python control layer and Flutter web application.

Persistent private state

Saved jobs, recovery data, project files, and the encrypted provider vault.

Private execution service

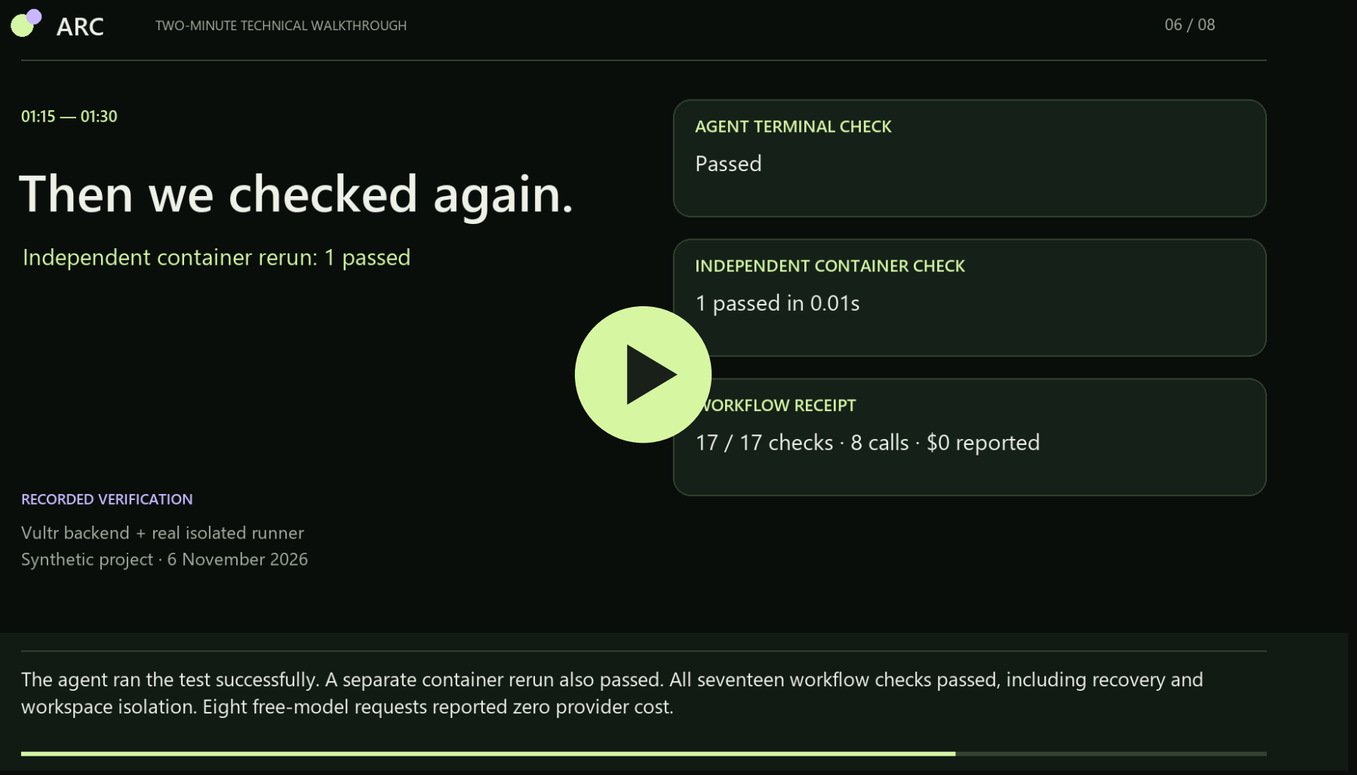

Private Linux broker. Real isolated checks and timeout cleanup verified.

Vultr Serverless Inference

Optional for Future of Work. Required for all agent LLM calls in Blast Radius Zero.

Deployment and verification details: github.com/rmalashqar25-byte/ARC

Watch the two-minute technical demo

120 seconds. Real evidence.

App captures, a delegated fix, and an independent passing test.

Watch technical demo

Original promo preserved

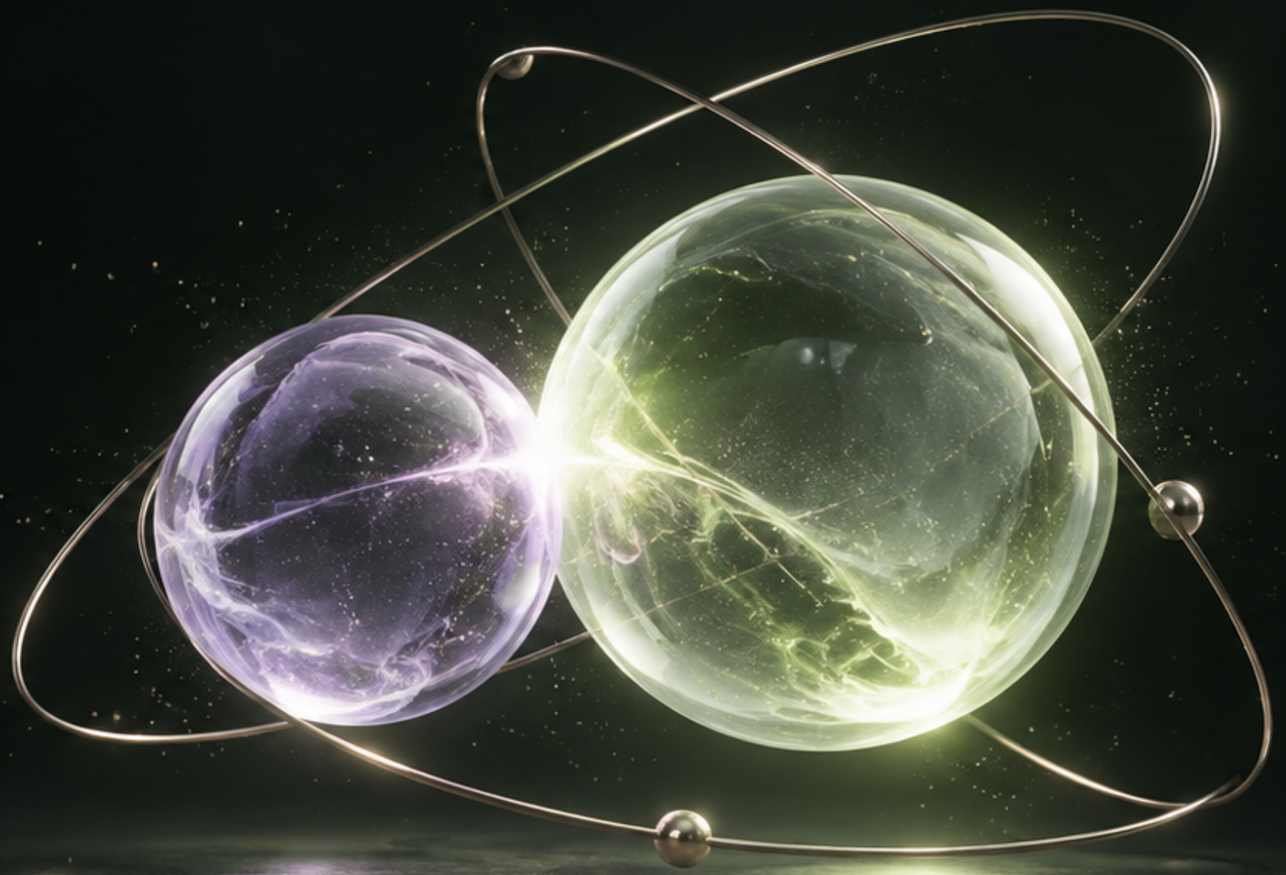

Both videos are available on the linked page.

Actual ARC interface captures and recorded synthetic verification. The original promo remains available.

ARC

Your company, with evidence.

Deployed on Vultr.
Built for teams that keep moving.
